

# Alignment of the ISBD: International Standard Bibliographic Description element set with RDA: Resource Description & Access element set

**Version 3.1, 17 February 2015**

## Introduction

This is the alignment of the consolidated edition of the ISBD: International Standard Bibliographic Description<sup>1</sup> element set with RDA: Resource Description & Access<sup>2</sup> element set.

The aim of the alignment is to enable harmonization between data produced according to the ISBD or RDA metadata content rules. Harmonization is achieved if the data is functionally interoperable; that is, data from both sources supports the functional requirements of each standard. Harmonization does not imply that the content is identical, so variation in content should be expected, although not sufficiently different to have a significant effect. The joint meeting of the ISBD Review Group and ISSN Network with the Joint Steering Committee for Development of RDA (JSC) held in Glasgow, 2011, defined functional interoperability as that by which “records valid under one of the standards should be capable of being mapped to either of the other standards. It is recognised that some issues will take longer to resolve than others and a few issues may prove to be irreconcilable, but steps can be taken to limit the impact of such differences.” The alignment task is defined in *Outcomes*<sup>3</sup>, Action 24. Mappings: JSC and ISBD agreed to set up a task group to look at Appendix D mappings between RDA and ISBD and between ISBD and RDA elements.

The ISBD element set is published in the consolidated edition of the ISBD (pp. 14-17), while the definitions in the table for ISBD elements are taken from the OMR. These definitions have been approved by the ISBD Review Group, and derive from the ISBD Glossary and the ISBD text. The scope notes of ISBD elements in the OMR have been taken into account in the alignment, but are excluded here for brevity. The RDA element set and definitions are taken from the RDA Toolkit, which is synchronized with the OMR.

The alignments include relationship designators taken from RDA Appendix J.

Information used to determine the alignments is taken, in order of priority, from:

1. Definitions
2. Scope notes
3. Other text in the documentation
4. Examples in the documentation

The alignments ignore:

- The assignment of FRBR Group 1 entities to the RDA elements.
- Differences in the sources of information for each element, as given in the documentation, except where they significantly affect the meaning or semantic of the element rather than just the content of specific instances.

The alignment shows that:

- There are elements lacking in one or the other content standard.
- The definitions of elements with the same label can be broader or the same irrespective of the standard.

The alignments given are not formal or operational mappings from ISBD elements to RDA elements. Instead, they are intended to support a variety of maps for different applications. For example, a specific application may choose to treat the three categories of alignment (broader, narrower, equal) as a single mapping type (approximately equal, or equivalent, etc.).

One such application is a map for the RDF (Resource Description Framework) representations of the *ISBD element set*<sup>4</sup> and *RDA element set*<sup>5</sup> in the *Open Metadata Registry*<sup>6</sup> (OMR:), using the methodology discussed in the *briefing/discussion paper*<sup>7</sup> tabled for the Glasgow meeting by Gordon Dunsire. The methodology uses the RDF Schema property “subPropertyOf” for narrower and broader alignments between so-called “unconstrained” properties, that is, properties that do not have a defined RDF domain or range.

## **Version 3.1**

Version 3.1 of the alignment includes changes in the RDA element set up to and including the February 2015 release of the RDA Toolkit. The RDF representation of the RDA element set was published in January 2014, with new URIs and a parallel set of unconstrained elements.

A parallel set of unconstrained ISBD elements with the same URI local part (with a different base domain) and the same definition but with no RDFS domain will be published in due course.

## Alignment of ISBD element set with RDA element set

Note: The direction of this alignment is **from ISBD to RDA only**. An alignment from RDA to ISBD will be developed separately.
